

Are your
medications
working for
you?

Be more informed.

Finding the right medication and dose is often a matter of trial and error.

Precision Prescribing with myDNA

Some people process certain medications too quickly and receive little or no benefit. Others process some medications too slowly and are at increased risk of side-effects.

A myDNA Test can identify common genetic variants that may affect your response to medications. Ultimately, helping with more informed prescribing and reducing the trial and error associated with finding the right medication.

A simple myDNA test can help you and your doctor be more informed to tailor your medications to your genetic profile.

The myDNA Personalised Medication Report covers a broad range of medications used in:

Psychiatry

Cardiology

Pain management

Gastroenterology

Benefits of a myDNA Medication Test

- ➔ Reduce the risk of adverse drug reactions
- ➔ Reach treatment goals sooner
- ➔ Reduce wasted time on 'trial and error' medicines
- ➔ Results are relevant for a lifetime

How It Works

Purchase a test and do the easy and convenient cheek swab.

Return your sample following the instructions provided.

Lab analysis - our lab analyses your DNA and the clinical team interprets your results.

Results are released to your doctor.

Organize a consult to discuss your results. A digital copy of your report can be provided by your doctor.

The test only needs to be done once and may also be relevant for other medications that you require in the future.
