

Are your  
medications  
working for  
you?

# Be more informed.

Finding the right medication and dose is often a matter of trial and error.

## Personalised Prescribing with myDNA

Some people process certain medications too quickly and receive little or no benefit. Others process some medications too slowly and are at increased risk of side-effects.

A myDNA Test can identify genetic variants that may affect your response to medications. Ultimately, helping with more informed prescribing and reducing the trial and error associated with finding the right medication.

**A simple myDNA test can help you and your clinician be more informed to tailor your medications to your genetic profile.**

# The myDNA Personalised Medication Report Covers A Broad Range Of Medications Used In:

Psychiatry

Cardiology

Pain management

Gastroenterology

## Potential Benefits of a myDNA Medication Test

- ➔ Reduce the risk of adverse drug reactions
- ➔ Reach treatment goals sooner
- ➔ Reduce time on 'trial and error' medicines
- ➔ Results are relevant for a lifetime

## How It Works

Scan QR code below and purchase the myDNA PGx Test

Once kit received; complete simple cheek swab, register your kit online and return sample via included reply paid envelope.

Lab analysis - our lab analyses your DNA and the clinical team interprets your results.

Results are sent securely to your nominated clinician within 7-10 business days after sample receipt at lab. Organise a consult with your nominated doctor to discuss your results and access a coloured copy of your report.

The test only needs to be **done once** and may also be relevant for other medications that you require in the future.

For enquiries and support please contact us on 1300 466 373 or [help@mydna.life](mailto:help@mydna.life)
